Subject: Summary of Landfill Gas Sampling Results
Nantucket Landfill - December 2010

Dear Mr. Ellis:

On December 6, 2010, personnel from Camp Dresser & McKee Inc. (CDM) conducted environmental monitoring at the Nantucket Landfill. The environmental monitoring included field screening for landfill gas. The environmental sampling was conducted in accordance with the approved Environmental Monitoring Plan, prepared by SECOR International Inc. in July 1999 and in conformance with the Solid Waste Management Regulations (310 CMR 19.132).

As part of the closure construction at the landfill, the environmental monitoring network was expanded with the addition of seventeen landfill gas wells (LGW-1 through LGW-17). See the site plan for locations of the landfill gas monitoring locations.

Landfill gas wells were screened in the field for the following parameters:

- Hydrogen Sulfide (H₂S);
- Methane (CH₄)
- Lower Explosive Limit (LEL);
- Carbon Dioxide (CO₂);
- Oxygen (O₂) and
- Volatile Organics (VOCs)

Evaluation of Results

Landfill gas wells were screened for the parameters indicated previously in this report. Prior to purging the wells, initial readings were taken at each location. Following recording of the initial readings, approximately 10 minutes was allowed for purging before final readings were recorded.

Mr. David Ellis
December 13, 2010
Page 2

Methane was only detected in one perimeter landfill gas well (LGW-9). Methane was detected at a concentration of 1018% of the LEL. LGW-9 is not located at the property line of the site. CDM conducted a probe (PROBE-1) approximately 6 feet from LGW-9. Methane was detected in PROBE-1 at a concentration of 12% of the LEL. CDM also conduct the second probe (PROBE-2) approximately 25 feet from LGW-9. Methane was not detected in PROBE-2. Each of the two probes was conducted at depths of approximately 8 feet below grade. Landfill gas is not currently migrating across the property line.

Methane was detected in wells LGW-14 through LGW-17 at concentrations ranging from 1194% to 1350% of the LEL. Wells LGW-14 through LGW-17 are located between Phase I and Phase 2A of the landfill. These wells are most likely located in waste or immediately adjacent to waste. LGW-1, LGW-10 and LGW-11 are located between the landfill and property line/buildings. Methane was not detected in these wells, indicating landfill gas migration is not currently violating solid waste regulations.

Carbon dioxide was detected in most well locations at concentrations ranging from 0.1 to 37.0 percent. Hydrogen sulfide was detected in sampling locations LGW-14 through LGW-17 at concentrations ranging from 10.2 ppm and 169 ppm. VOCs were not detected in any sampling locations. Sampling locations are shown on the attached plan and complete sampling results are summarized in Table 1.

CDM submitted a 24-hour notification to MassDEP on December 7, 2010 via email. The next quarterly landfill gas screening is scheduled for March 2011.

Please do not hesitate to call me at (617) 452-6659 if you have any questions or require additional information.

Very truly yours,

Vincent M. Recchia, P.E.

Notes:

1. Wells and probes were purged for approximately 10 minutes before final readings were recorded.
2. Methane measured with combustible gas indicator.
